

One invitation per email

A guest's email can now have only one invitation, across every collection, in the TOURISE 2027 admin. 5 October 2026.

1. In short

Until now the same email could be invited again in a **different** collection, and even inside one collection the check only worked in some screens. Now an email can have **only one invitation in the whole system**, whatever state that invitation is in (used, sent or inactive). The rule applies everywhere an invitation is made: the invitation screens, accepting invitation requests, and dignitary parties.

What you need to do: nothing. To invite someone who already has an invitation into another collection, **move** their invitation (More, then Move to collection) or edit it, instead of creating a new one.

Status (5 October 2026): on the development version for testing; it reaches production with the next release. No clean-up is needed: the invitations on production today are test data.

2. What changed in the invitation screens

Where	Before	Now
Create a collection (manual cards)	Duplicates checked only between the cards on screen	Each card is checked while typing against every invitation: "This email already has an invitation"
Create a collection (Excel)	Duplicates checked only inside the file	Rows already invited turn red , the preview counts them, and Create lists them in the problems dialog with the registered ones
Add people	Refused only if already in the same collection	Refused if already invited anywhere
Edit one invitation's email	Checked only in the same collection, and only in the browser	A new email is refused if any other invitation has it. Editing the rest of an invitation is never blocked
Move to collection	Moves the same invitation	Unchanged: a move never creates a second invitation

Messages never name the other collection, so an admin limited to some categories does not learn about collections they cannot see.

3. Effects on invitation requests

- **Accepting a request whose email already has an invitation is refused** with "This email is already invited." The request **stays pending**, so the reviewer can reject it, or fix the existing invitation first.
- **Bulk accept** handles the others normally and lists the refused ones as failed, with the same reason.
- **The public request form and the partner API do not check invitations.** They refuse an email that is already a registered guest or already requested, as before, but a person an admin has already invited can still **submit** a request. It is only refused when someone tries to accept it. Stopping it at the form would be a separate change (the public email lookups are already an open security question).

4. Effects on dignitary parties

- **A dignitary naming someone who already has an invitation** (in their own registration form): that person is **skipped quietly**. The dignitary's registration still succeeds, and the person keeps the invitation they already have.
- **Two dignitaries naming the same person:** only the first one creates an invitation. The person appears in **the first dignitary's party only**, because a party lists the invitations made on that dignitary's behalf.
- **"Invite someone" on the Dignitary page** (by the team): refused with "This email is already invited."
- **The same dignitary naming the same person again** in the same role still returns their existing invitation, so a re-send works as before.

5. What to check

Use the test (development) admin. Write **Pass** or **Fail** in the last column.

#	Steps	Expected result	Pass / Fail
1	Create collection A with a guest test1@example.com	Saved	
2	Create collection B ; on a manual card type TEST1@example.com	Red under the field: "This email already has an invitation". Create is refused	
3	In one Create, use the same new email on two cards	"Duplicate email"	
4	Create B from an Excel file that includes test1@example.com	That row is red, the preview says "1 already invited", Create opens the problems dialog	
5	Add people to an existing collection with test1@example.com	Refused	
6	Open another invitation, change its email to test1@example.com	Refused	

#	Steps	Expected result	Pass / Fail
7	Edit that invitation's company only, keep its email	Saved	
8	Move invitations from one collection to another	Works as before	
9	File an invitation request with <code>test1@example.com</code> , then Accept it	Refused: "This email is already invited." The request stays pending	
10	Bulk accept that request with another one	The other is accepted; this one is listed as failed with the same reason	
11	On the Dignitary page, Invite someone with <code>test1@example.com</code>	Refused: "This email is already invited."	
12	Register a dignitary who names <code>test1@example.com</code> in their party	Registration succeeds; no new invitation for test1	
13	Do any of the above with a brand-new email	Works normally	

6. For developers

- **The rule:** `Invitation::alreadyInvited($emails, $exceptId)` (trimmed and lower-cased on both sides, any state, any collection).
- **Applied in:** `InvitationsController` (`store` and `addGuests` through `refuseInvitedEmails()`, which also refuses repeats inside the batch; `update` checks a changed email; `check-unique` checks every collection; new `POST /admin/invitations/check-emails-list`), `AdminInvitationRequestsController::accept` (409), `DignitaryParty::invite` (skip) and `DignitaryPartiesController::invite` (422).
- **Admin:** `invitations-form.tsx` (manual cards, Excel preview and problems dialog, import note), `table-add-info-modal.tsx` (edit). EN + AR.
- **Tests:** `InvitationEmailUniqueTest` (6) and one in `DignitaryPartiesTest`, all failing on the code before. Backend 1058 tests pass.
- **Commits:** backend `36a325c` (PR #39), admin `eb4b772` (PR #40), on `dev`. No migration.
